Problem Statement

The challenge

A small company needs a backend where managers assign tasks to employees, and employees update the status of tasks assigned to them.

No employee may modify a task that is not assigned to them, and tasks must be filterable by status and due date.

Role-based assignment

Only managers create and assign tasks

Ownership-based updates

Employees change only their own tasks

Task filtering

By status and due date

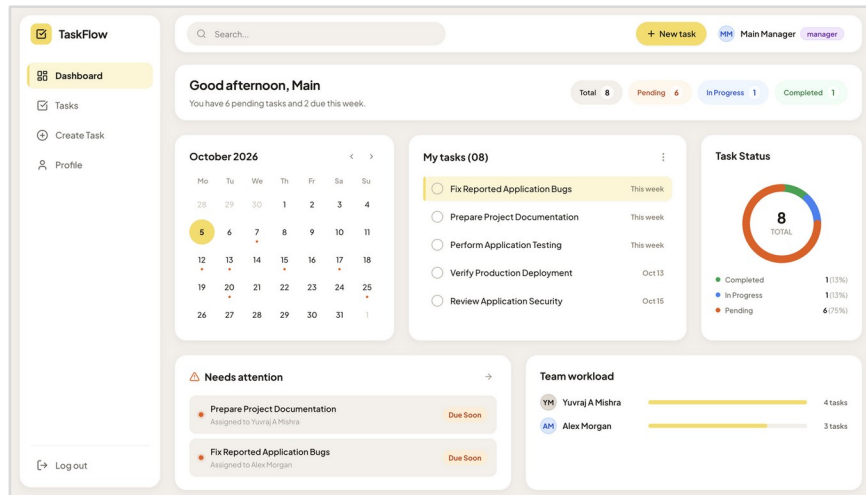

Data validation

Task fields checked on create and update

Our Solution: TaskFlow

A full-stack web app where managers assign work and employees track it.

-  JWT login with Manager and Employee roles
-  Tasks with due dates and Pending, In Progress, Completed status
-  Filter by status and due date, plus search and sort
-  Password recovery with a security question

Manager dashboard

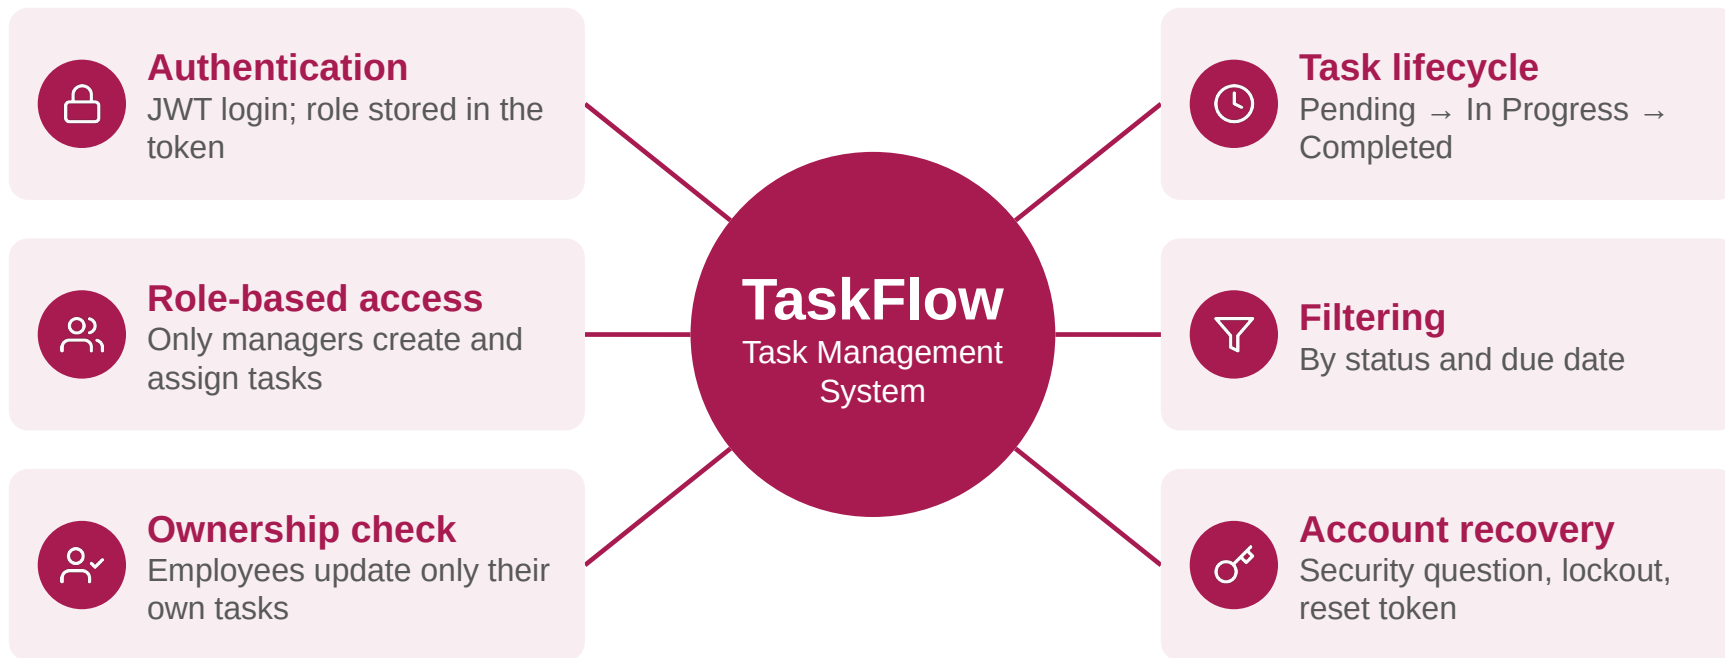

React + Vite

Node + Express

MongoDB

How TaskFlow Works

Conclusion

10/10

requirements passed in the
final audit

2

roles: Manager and
Employee

3

task statuses tracked end
to end

TaskFlow lets managers assign work and employees update only their own tasks, with every rule enforced on the backend.
